Materials Science and Technology 2005

Ferrous Physical Metallurgy of Highly Alloyed Steels: Stainless Steels

Pittsburgh, PA September 25-28, 2005

9-12 Cr Steels

- Various martensitic 9-12 Cr steels are utilized in advanced energy plants for their good elevated temperature properties:
 - Creep strength
 - Steam side oxidation resistance
 - Fire side corrosion resistance
 - Thermal fatigue resistance

Applications

- **Boilers:**
 - Superheater tubing
 - Headers
 - Steam pipes
- **Steam Turbines:**
 - Rotors
 - Casings
 - Valves
 - Inlet pipes

Motivation for Current Research

- Need for further improvements on the properties for higher temperature ($>600^{\circ}\text{C}$) use driven by the environmental concerns (i.e., improve efficiency to reduce emissions and fossil fuel consumption)

Objective

- Explore new substitutional solute solution (Cu, Co) and precipitate (TiC) hardening mechanisms for improved strength of 9-12 Cr martensitic steels

Alloy Design

Fig. 12.4 Schaeffler diagram. Effect of alloying elements on the basic structure of Cr-Ni stainless steels (Schneider and Climax Molybdenum Co., *Foundry Trade J.* **108**, 562, 1960).

Nominal Composition of Alloys (wt%)

Alloy	Fe	Cr	Cu	Co	Mo	Ni	Ti	C	Mn	Si	Other
HR52	Bal	9	3	3	0.7	1	0.5	0.1	-	-	
HR53	Bal	10.5	3	4	0.7	1	0.5	0.1	-	-

Effect of Cr on the equilibrium phases

HR52 (9%Cr)

HR53 (10.5%Cr)

HR54 (12%Cr)

Melting and Casting

- Experimental steels were vacuum induction melted using elemental charge materials
- They were poured into ceramic coated, 2 in diameter graphite molds

Microstructure of steels in the as-cast condition

HR52 (9Cr)

HR53 (10.5Cr)

HR54 (12Cr)

50 μm

Martensite vs ferrite

Thermomechanical Treatment

- Rolled at 750°C for 83% reduction in 14 passes
- Heat treated at 750°C for 1, 10, 100, and 1000 hours.

Choice of 750°C for heat treatment

Effect of Mn and Si

Summary

- Thermodynamic calculations predict equilibrium phases as bcc-Fe, TiC, and Cu-rich phase at the possible application temperature range of 600-650C for the experimental 9-12Cr steels.

Summary continued

- In both the as cast and rolled conditions, these steels are primarily martensitic with some ferrite.
- As the Cr level increases from 9 to 12 wt%, amount of delta ferrite in the matrix increases.

Summary continued

- Both TiC and Cu-rich precipitates provide strengthening.
- After up to 100h treatment at 750C, the TiC precipitates do not coarsen significantly. On the other hand, the Cu-rich precipitates coarsen at a faster rate.

Summary continued

- Effect of Si and Mn additions on the oxidation resistance and mechanical properties is being studied.
